

Guest Access:

When people outside your company attempt to use your company's network to access the internet or the resources and services in your network, you can provide them with network access using Guest Access portals. Guests typically include authorized visitors, contractors, customers, or other temporary users who require access to your network. Guest Portal is a way of providing the network access to the visitors/guests who are visiting less frequently unlike the employees of the organization. Basically the guests require Internet access to access their corporate emails and other resources over the Internet. There are three default Guest Portals **Hotspot Guest portal**, **Sponsored-Guest portal** and **Self-Registered Guest portal**.
